

November 7th, 2011

The 2008 VW R32 version of the VW Golf is a unique combination of mechanical options that makes for a very well balanced, capable fun driving experience. The Haldex all wheel drive, 6 speed DSG transmission and 3.2L V6 engine provide the underpinnings for a true performance car with all the amenities of a luxury, yet economical car. HPA of Canada has parlayed that robust foundation into a true super car by providing several levels of upgrades; the latest addition is their 20th anniversary turbocharged option. This OEM quality installation integrates engine and optional transmission and differential control to provide a smooth docile driver when wanted and a strong accelerating quick shifting safe driving rush when you put your foot into the throttle. With power upgrades to more than double the stock offering, you can run 0-60 times in the low 3 second range without any wheel spin, turn corners like you are on rails, stop on a dime, all while going out to pick up the groceries. You will look for every reason to take this HPA creation out for a spin. No other modified vehicle I have driven has the ability to be comfortably driven, slowly, cheaply, quietly and respectfully in all weather conditions yet always letting you know that it has the heart to provide whatever greater level of performance you may want. That is what makes the HPA/R32 truly something special. The transformation is nothing short of spectacular to drive!

Sincerely,

Dennis E.
